LOAD FLOATER II

Optimum fruit protection

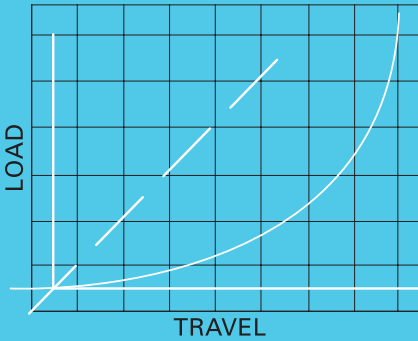

Loadfloater II forklifts float their way through the busiest harvest.

We've made our **Loadfloater II** bin handling system even better - reducing costly damage to pipfruit, stonefruit and other produce whilst increasing productivity.

The backframe has been set back to avoid any contact with the bins. The RSE spring elements are entirely frictionless and because of their low natural frequency they don't need shock absorbers to dampen oscillation. The 6 roller system has sealed bearings with a heat-treated precision machined roller for longer working life.

Traditionally the slower you travelled, the lesser the fruit bruising. Hustlers' **Loadfloater II** allows you to travel faster, knowing you're not knocking your fruit around.

RSE rubber spring elements

LF1250

LF700

Add these practical rules to the Loadfloater II performance and you'll reap the benefits of better quality fruit, reduced wastage and INCREASED PROFITS.

- If necessary add weight to the front of the forklift for safer steering
- If possible, adjust your lowering rate to avoid heavy bin contact with the ground
- Smooth and maintain your orchard tracks
- Observe correct tyre pressures
